

Electric designers can collaborate

IGE+XAO has announced a new version of its SEE Electrical Expert software which allows several users to work simultaneously on CAD projects with any changes being visible instantly to all of the collaborators. Version 4 of the software also focuses on performance and openness.

The software now includes an electrical data explorer which allows quick editing of project data. Searching is said to be faster and navigation between different representations of the same equipment is almost instantaneous. The new version can export project data as a spreadsheet, which can be modified in Excel and imported back. The large data volumes handled by spreadsheets is said to make this process faster and easier. It is also possible to initialise a new project from an Excel file containing project data defined during a preliminary project phase. Version 4 also offers a new Solidworks-based panel design function.
